for every schwab – paternoster

Utility model protected (DBGM)

The safety chain deflection **SIKU** provides permanent, dependable protection against tampering, injuries and the falling out of rolls of material goods in paternosters.

Technicaldescription:

All other paternosters to date required one or more sprockets in the lower machine area for chain deflection. These sprockets present a source of danger, as squeezing and cutting points still develop between the chain and sprocket in spite of being covered.

Instead of sprockets, the **SIKU** utilises a continuous guide enclosure made of steel within which the chain is inevitably deflected. Sprockets and – along with them – squeezing and cutting points are eliminated. This prevents the risk of being caught in the chain. In the user operating area the chain is guide from top to bottom by a protective grating; this offers additional protection against the falling out of rolls.

Application:

SIKU chain deflection is used in all schwab paternosters models TPL, FPL, CPL as standard equipment. Retrofitting of earlier models also possible.

Special features:

- h Optimum, permanent protection agains injury and contamination, as the chain is completely enclosed.
- h Entirely maintenance-free
- h Retrofitting for all schwab paternosters
- h Economically priced.
- h TÜV (German technical QC authority) tested.
